Complete Business Analysis Project

Technical Analysis Report

Prepared by: Nitish Kumar

1. Project Overview

This project analyzes House Prices, Customer Churn and Sales Data to identify business patterns.

2. Business Problem

Businesses need reliable data analysis to improve customer retention, pricing decisions and sales performance.

3. Dataset Description

Three datasets containing house price, customer churn and sales information were used.

4. Data Cleaning

Column names were standardized, duplicate records were removed and missing values were handled.

5. Exploratory Data Analysis

Statistical summaries, numerical analysis, categorical analysis and correlation analysis were performed.

6. Data Visualization

Histograms, count plots and correlation heatmaps were created to understand data patterns.

7. Statistical Analysis

Descriptive statistics, correlation, IQR outlier detection and Chi-Square testing were applied.

8. Machine Learning

Logistic Regression was used to explore customer churn prediction.

9. Business Recommendations

Improve customer retention, monitor sales performance and use property data for pricing decisions.

10. Conclusion

The project demonstrates how Python-based analysis can support business decision-making.
